

# C182 Introduction to Information Technology

## Course Tips

1. It will be helpful to schedule a brief introduction appointment with your course instructor to discuss the best plan for you to participate in the course.
2. You should carefully read and participate in your online Course of Study for the course.
3. The most robust module for students is usually module 15. Additional modules that may require extra attention are modules 2, 16, 17, and 18. Also, memorize the list of compiled languages versus the list of scripting languages as these are common questions for all the Objective Assessment attempts.
4. For module 21, learn which activity occurs in which project management phase. For module 26, learn the federal regulations, their names, abbreviations, and what each regulation protects.
5. Develop an understanding of the "SELECT" statement in SQL and what comes after "SELECT", what comes after "FROM", and what comes after "WHERE".
6. Also, please watch the **Starting C182** cohort video for additional course information. \*
